

GS-TA1 Turner Accumulator

Accumulator

The TA1 is designed for high output inline configurations, working in conjunction with 2 Mattress Master tape edge closing machines. The TA1 accepts the mattress from the first Mattress Master, turns it over and passes it on to the second for completion.

By holding 2 mattresses at a time the TA1 creates a buffer stock to ensure the second machine is never kept waiting.

The machine will match the capacity of any other component in your Gateway mattress production system and will handle all standard mattresses from small single to large king size, 2 metres x 2 metres.

Reliability is assured by the rugged heavy duty hollow section steel frame and top quality branded components.

In common with all Gateway equipment the TA1 incorporates the benefits of our specialist expertise and is supported by our highly skilled and experienced team.
